

RYAN DENMARK

Backend Software Engineer | Java & SQL | Data Pipelines & API Integrations

Eagan, MN • ryanwdenmark@gmail.com • (651) 497-9878 • linkedin.com/in/rwdenmark • rwdenmark.github.io

PROFESSIONAL SUMMARY

Backend engineer with 7+ years on cross-functional teams, building production pipelines and HIPAA-regulated integrations that move high-volume data across partner systems. Ships reliably under audit pressure against strict data formats, even when submissions arrive incomplete or out of spec. My best work makes a complicated system understandable to the people who use it, and almost always starts with the client conversations that shape it.

TECHNICAL SKILLS

Tech Stack: Java, Spring Boot, MySQL, REST APIs, XML, JSON

Tooling & Cloud: IntelliJ IDEA, Git, GitHub, Gradle, Postman, CI/CD, Bash, Microsoft Azure, GitHub Copilot, Anthropic Claude

Data & Architecture: multi-stage scheduled-job pipelines, ETL/ELT, entity matching/resolution, schema translation, relational databases, partner integrations (X12 EDI, file feeds, REST APIs)

Standards & Compliance: Healthcare claims processing, HIPAA, HITRUST, SOC 2, and X12 EDI transactions covering 837 (Claims), 835 (Remittance), 834 (Enrollment), 270/271 (Eligibility/Status), 277CA (Claims Ack), 999 (Functional Ack)

Engineering Practice: Ownership from design through production. Code review and mentorship. Cross-functional collaboration across product, business, and engineering. Debugging and troubleshooting under production pressure. AI-assisted development for daily code generation and review. On-call for production incidents

PROFESSIONAL EXPERIENCE

Smart Data Solutions, Eagan, MN

Feb 2019 – May 2026

Healthcare claims processing and payer integration platform

Software Engineer II, Dec 2024 – May 2026

- Lead engineer, mentoring junior developers and reviewing code across the wider development team.
- Refactored commonly duplicated client logic for mapping, validation, and routing into shared base classes, so new implementations could extend proven code instead of re-implementing it.
- Diagnosed a defect in an abstract class affecting roughly 15% of the client base and drove the fix to production, restoring a critical processing queue and retiring a manual dashboard workaround.
- Owned 5+ heavily customized client implementations, delivering each on schedule and stable in production.
- Led 5+ pre-kickoff design reviews on the team's most complex implementations, surfacing risks early so deadlines and project plans matched true scope.

Software Engineer I, Apr 2021 – Dec 2024

- Delivered 25+ client implementations from requirements through go-live.
- Designed and built multi-stage scheduled-job pipelines (staged as import, parse, validate, export, transport) handling thousands of transactions per client per day.
- Implemented bidirectional partner data routing for 30+ partners through mixed protocols (X12 EDI, REST APIs, custom flat-file formats), reusing the platform's standard pipeline framework.
- Developed entity-matching logic that standardized claim data against eligibility records on 80% of implementations, routing unmatched cases into client-specific fallout flows.
- Shipped HIPAA-regulated integrations across the full X12 EDI transaction set. Implementations passed HITRUST and SOC 2 audits over 7 years with no findings in code I owned.

Support Engineer, Feb 2019 – Apr 2021

- Resolved 1000+ client tickets generating \$300K+ in billing with zero formal escalations.
- Trained 5+ new hires through manager-assigned paired shadowing, ramping them to solo ticket work within a few weeks.

Beyond Impact, Infrastructure Support Specialist

May 2017 – Jan 2019

- Supported 30+ client Azure environments on a monthly production on-call rotation, and deployed SCCM across the fleet to automate Windows security updates and software distribution.

EDUCATION

Bachelor of Science, Computer Science (Minor in Mathematics), Bemidji State University, Bemidji, MN

May 2017
